Experiment 5.2: Student grade based on aggregate

Algorithm:

```
Step 1: START
Step 2: INPUT m1, m2, m3, m4  (four integers, space-separated)
Step 3: CALCULATE  total     = m1 + m2 + m3 + m4
Step 4: CALCULATE  aggregate = total / 4
Step 5: OUTPUT total
Step 6: OUTPUT aggregate  (formatted to 2 decimal places)
Step 7: CHECK aggregate:
            IF aggregate >= 75            → OUTPUT "Distinction"
            ELSE IF aggregate >= 60       → OUTPUT "First Division"
            ELSE IF aggregate >= 50       → OUTPUT "Second Division"
            ELSE IF aggregate >= 40       → OUTPUT "Third Division"
            ELSE                          → OUTPUT "Fail"
Step 8: STOP
```

5.1.2. Student Grade Based on Aggregate

01:59

Write a program to calculate the total marks, aggregate percentage, and grade of a student based on marks in four subjects. The grade is determined as follows:

- Aggregate > 75%: Distinction
- Aggregate >= 60% and < 75%: First Division
- Aggregate >= 50% and < 60%: Second Division
- Aggregate >= 40% and < 50%: Third Division
- Aggregate < 40%: Fail

Input Format:

- Four space-separated integers representing the marks in four subjects.

Output Format:

- The first line should print the total marks.
- The second line should print the aggregate percentage with two decimal places.
- The third line should print the grade.

Constraints:

- 0<=marks in each subject<=100

Debugger

```python
# Input: four space-separated integers
m1, m2, m3, m4 = map(int, input().split())

# Calculate total marks
total = m1 + m2 + m3 + m4

# Calculate aggregate percentage
aggregate = total / 4

# Print total and aggregate (2 decimal places)
print(total)
print(f"{aggregate:.2f}")

# Determine grade
if aggregate >= 75:
```
